NEWCASTLE DISEASE VIRUS ANTIBODY TEST KIT
For the detection of antibodies to Newcastle Disease Virus (NDV) in chickens.

GENERAL INFORMATION AND INTENDED USES
ProFLOK™ NDV Ab is a rapid routine monitoring ELISA for the detection of pre- and post-vaccination NDV antibodies in chickens.

KIT COMPOSITION AND CONSERVATION
Contains materials sufficient to test a maximum of 450 samples.

</table>

Store all reagents provided in the kit at 2 – 7 °C. Reagents should not be frozen.

REAGENTS REQUIRED TO PERFORM 90 TESTS
a) 1 NDV antigen coated microplate
b) 10 µL 100X Positive Control
c) 10 µL 100X Normal Control
d) 120 µL 100X Conjugate
e) 46 mL Dilution Buffer
f) 20 mL 20X Wash
g) 10 mL Substrate
h) 2.5 mL 5X Stop

EQUIPMENT AND MATERIALS REQUIRED, BUT NOT PROVIDED
a) High precision multiple delivery pipetting devices (i.e., 1-20 and 20-200 µL. Measurement deviation must be ≤ 10 % for volumes ≤ 10 µL and ≤ 5 % for all other volumes)
b) 8- or 12-channel pipettes (i.e., 5-50 and 50-300 µL) and pipette tips
c) 0.2 mL, 1.0 mL, and 5.0 mL pipettes
d) 2 graduated cylinders (50 mL)
e) 1 mL or 5 mL glass test tubes
f) Uncoated low binding 96 well microplates with > 300 µL/well volume
g) Deionized or reverse osmosis water
h) Microplate reader with 405-410 nm filter
i) Microplate washing apparatus

ProFLOK™ NDV Ab
WARNINGS TO THE USERS OF REAGENTS AND ANTIGEN COATED MICROPLATES

- Handle all reagents and samples as biohazardous material. It is recommended to dispose reagents and contaminated material according to the applicable regulations.
- Wear suitable protective clothing.
- Irritating to eyes and skin. Keep all reagents away from eyes and skin. In case of contact with eyes, rinse immediately with plenty of water and seek medical advice.
- Take care not to contaminate any test reagents with serum or bacterial agents.
- If the humidity indicator of a microplate exhibits a pink color, the microplate should not be used.
- The best results are achieved by following the protocols described below, using good, safe laboratory techniques.
- Never add water to the microplates, conjugate, controls, or substrate.
- Do not use this kit after the expiration date.
- NEVER PIPETTE BY MOUTH. Harmful if swallowed.
- For animal use only.

Refer to the end of this insert for reagent hazard and precaution statements. Also reference the Safety Data Sheet for additional details.

SAMPLE COLLECTION

For routine serologic flock monitoring:
- Randomly collect a statistically significant number of samples at routine intervals (for example, collect 30 sera every 21 days).
- Follow proper sample collection procedures.
- Harvest serum and store properly (up to seven days at 4 °C, -20 °C for longer).
- Test only good quality serum (i.e., avoid bacterial contamination, heavy hemolysis or lipemia). When in doubt, obtain a better quality sample.

SAMPLE DILUTION PROCEDURE

Dilute serum samples using the dilution buffer provided in a clean, uncoated 96 well microplate (Sample Dilution Microplate). Samples should be completely thawed and thoroughly mixed before diluting. Allow all reagents to come to 21 – 24 °C before starting.

Note: This sample dilution microplate provides adequate quantities of diluted serum samples to conduct four additional ProFLOK™ ELISA tests. Use dilution microplate within 24 hours.
PREPARATION OF 1X POSITIVE CONTROL, 1X CONJUGATE, 1X WASH, AND 1X STOP SOLUTIONS

**STEP** | **UNITS** | **MATERIAL** | **LOCATION** | **NOTES**
--- | --- | --- | --- | ---

**1X POSITIVE CONTROL SOLUTION**
6) 300 µL | Dilution buffer | Clean test tube | Mix well; 1:50 final dilution.
7) 6 µL | 100X Positive Control | |

**1X CONJUGATE SOLUTION**
8) 12 mL | Dilution buffer | Clean tube or bottle | Mix well; 1:100 final dilution.
9) 120 µL | 100X Conjugate | |

**1X WASH SOLUTION**
10) 20 mL | 20X Wash | Microplate washing bottle or apparatus | Mix well; 1:20 final dilution.
11) 380 mL | Deionized or reverse osmosis water | |

**1X STOP SOLUTION**
12) 2.5 mL | 5X Stop | Clean tube or bottle | Warm 5X Stop to 21-24 °C or to 37 °C and mix to dissolve any precipitates.
13) 10 mL | Deionized or reverse osmosis water | Mix well; 1:5 final dilution

**ELISA TEST PROCEDURE**

**STEP** | **UNITS** | **MATERIAL** | **LOCATION** | **NOTES**
--- | --- | --- | --- | ---
a) Remove the test microplate from protective bag and label the microplate with the flock/sample positions as in step 2.
b) 50 µL | Dilution buffer | Add into each test microplate well |
c) 50 µL | 1X Positive Control Solution (step 7) | A1, A3, and H11 | Discard pipette tips; 1:100 final dilution.
d) 50 µL | Sample Dilution Microplate (step 5) | Transfer to the matching wells of the test microplate | Quickly transfer each row. Discard pipette tips; 1:50 final dilution.
e) Incubate for 30 minutes at 21 – 24 °C.

**WASH PROCEDURE**

**STEP** | **UNITS** | **MATERIAL** | **LOCATION** | **NOTES**
--- | --- | --- | --- | ---
f) Discard or aspirate solution from all wells. | | | Tap inverted plate.
g) 300 µL | 1X Wash Solution (step 11) | Each test well | Soak for 3 minutes
h) After 5 minute soak, aspirate all wells; tap inverted plate to remove residual liquid. | | | Wash process is a critical step for an ELISA. Please follow steps f to i.
i) Repeat wash procedure 2 more times. | | | |
**ADDITION OF 1X CONJUGATE, SUBSTRATE, AND 1X STOP SOLUTION**

</tbody>
</table>

**RESULTS**

**ASSAY CONTROL VALUES, VALID ELISA RESULTS**

Valid ELISA results are obtained when the Normal Control Average optical density (OD) is < 0.250 and the Corrected Positive Control (CPC) is between 0.250 and 0.900. If any of these values are out of range, the test results should be considered invalid and the samples should be retested.

**MANUAL PROCESSING OF DATA**

a) Average the OD values of Positive Control in wells A1, A3, and H11 then average the OD values of Normal Control in wells A2, H10, and H12. Record both averages.

b) Subtract the average Normal Control OD from the average Positive Control OD. The difference is the Corrected Positive Control.

c) Calculate a sample to positive (S/P) ratio by subtracting the average Normal Control OD from each sample OD and dividing the difference by the Corrected Positive Control. Use the following equation format:

\[
S/P = \frac{\text{SAMPLE OD} - \text{AVERAGE NORMAL CONTROL OD}}{\text{CORRECTED POSITIVE CONTROL}}
\]

d) An ELISA titer for NDV can be calculated by the following suggested equation:

\[
\text{LOG}_{10} \text{TITER} = (1.464 \times \text{LOG}_{10} \text{S/P}) + 3.740
\]

\[
\text{TITER} = \text{ANTILOG} \text{ of LOG}_{10} \text{TITER}
\]

**EXAMPLE:**

Example Positive Control ODs:

<table>
<thead>
<tr>
<th>0.585</th>
<th>0.610</th>
<th>0.590</th>
</tr>
</thead>
</table>

Average = \( \frac{0.585 + 0.610 + 0.590}{3} = 0.595 \)

Corrected Positive Control:

\( (0.595) - (0.067) = 0.528 \)

Example Normal Control ODs:

<table>
<thead>
<tr>
<th>0.078</th>
<th>0.067</th>
<th>0.057</th>
</tr>
</thead>
</table>

Average = \( \frac{0.078 + 0.067 + 0.057}{3} = 0.067 \)

Example S/P value calculation:

\( 0.078 - 0.057 = 0.021 \)

Example of Calculation of titer:

\( \text{LOG}_{10} \text{Titer} = (1.464 \times \text{LOG}_{10} 0.934) + 3.740 \)

\( \text{Titer} = \text{ANTILOG} 3.70 \)

\( \text{Titer} = 4973 \)

ProFLOK™ NDV Ab
INTERPRETATION OF RESULTS

The NDV ELISA titer values obtained represent a comparison of the NDV antibody level within each field chicken serum tested and the NDV ELISA kit positive and normal control sera. Therefore, it is important to first determine that the NDV ELISA positive and normal control sera values obtained are valid as detailed above in the “Assay Control Values, Valid ELISA Results” section of this pamphlet before NDV ELISA results are interpreted.

The NDV S/P values obtained for sera should be interpreted as follows:

NDV Presumed Antibody Status:

<table>
<thead>
<tr>
<th>S/P 0.150</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serum</td>
</tr>
<tr>
<td>-</td>
</tr>
<tr>
<td>+</td>
</tr>
</tbody>
</table>

a. **Negative.** Serum samples with an NDV S/P ratio value of ≤ 0.150 receive a “0” titer value and are presumed negative for NDV antibody. A “0” NDV ELISA titer represents a chicken serum sample that contains an extremely low to insignificant NDV antibody level compared to the NDV ELISA kit positive and normal control sera.

b. **Positive.** An NDV ELISA titer value above “0” indicates only that a chicken serum sample contains a significant and ELISA-detectable NDV antibody level compared to the NDV ELISA kit positive and normal control sera. However, these titers do not imply or ensure “protection” nor provide serologic differentiation between an NDV vaccine response or NDV field infection.

Optimal NDV vaccine administration practices and “protective” flock NDV titer target values must be determined by each NDV ELISA kit user by comparing flock pre- and post-vaccination NDV ELISA results (i.e., coefficient of variation [%CV] and geometric titer [GMT] values) with flock performance parameters, (i.e., morbidity, mortality, flock body weight gain or uniformity) over time.
