RIMADYL Chewable Tablets:

COMPLIANCE

UNLEASHED
The Importance of Compliance for Dogs with Osteoarthritis

- Canine osteoarthritis is a progressive, inflammatory condition that not only causes pain but contributes to irreversible joint damage.¹

- Fortunately, studies show that continuous long-term use of NSAIDs provides clinical benefits, without an increase in the rate of side effects.²,³ Specifically, using RIMADYL® (carprofen) over the long term has been found to be safe and improve clinical signs.²,⁴

- However, making sure your clients administer RIMADYL regularly can be a challenge.

- There is important new information now available that may help you improve compliance with your dog owners.

Barriers to Compliance

It’s no secret that pet owner compliance with medication recommendations tends to be poor, especially when it comes to chronic diseases which require administering pills regularly. In 2009, the AAHA compliance follow-up study examined pet owner and veterinarian compliance in many areas. In 2011, Zoetis, Inc. looked further into compliance with a market research study completed by pet owners and veterinarians specifically on NSAIDs.

Why do owners miss doses?

In a 2011 Zoetis, Inc. Compliance Study, the majority of dog owners reported skipping or missing doses because they believe their dog didn’t seem to need it.⁵ However a recent study found that pet owners often do not recognize the extent of pain their dog is suffering. It was only after owners observed pain diminish with NSAID use then return after discontinuing NSAID did pet owners have a better understanding of the degree of pain the dog was experiencing.⁶

What role does cost play in compliance?

Although cost may often be perceived as the greatest barrier to compliance, several studies have found that cost does not correlate to compliance. In fact, of pet owners polled in the AAHA compliance study:⁷

- Approximately 40% said they would pay more for a more palatable formulation
- Around 60% said they would pay more for drugs with a more convenient dosing schedule

Additionally, the 2011 Zoetis, Inc. Compliance Study found that when pet owners perceive that medication is needed, surprisingly, for most, cost was not a determining factor.⁷
Although pain is the hallmark clinical sign of osteoarthritis, it can be subtle and often goes unnoticed. Many dog owners may not understand osteoarthritis is a progressive and inflammatory disease.

- Dog owners might not recognize subtle signs — attribute subtle changes to “old age” or “slowing down”
- Because dogs mask pain, the degree of pain may not be appreciated, especially with busy lifestyles.
Improving Compliance For Better Patient Outcomes

Easy-to-Administer Formulations Improve Compliance

Chewable tablets were reported as being the easiest medication to give.

Veterinarians and Dog Owners Prefer Chewable Tablets for Compliance

Veterinarians perceive that chewable formulations result in better compliance when compared to liquids and caplets

Dog owners prefer chewable tablets for NSAID

AAHA Compliance Study
A Simple Dosing Schedule Improves Compliance

- Less frequent dosing is significantly associated with compliance.5
- Owners are far more likely to comply with recommended dosing and not miss a dose when medication can be given fewer times a day.
- RIMADYL® (carprofen) chewable tablets are approved for once or twice-daily dosing for flexible and easy dosing options.
- In studies, RIMADYL chewable tablets given once-daily had similar efficacy and safety profiles as twice-daily administration.8

Communication Improves Compliance

- In the 2009 AAHA compliance study, greater communication between pet owners and veterinarians was significantly associated with better compliance and an increased number of dog owners who reported never missing a dose.7
- Interestingly, the 2011 Zoetis, Inc. Compliance Study found that dog owners who purchase products from veterinary clinics tend to do so in part because of the expert advice their veterinarians provide.5
- The time you spend talking with dog owners—about their pet’s health, how to manage chronic conditions like osteoarthritis, and the importance of administering their pet’s medication as recommended— not only helps improve compliance, but builds trust and strengthens their relationship with you. So when you make recommendations, your clients are more likely to follow them.
- You can help your clients follow your recommendations for daily NSAID use by explaining the benefits of continuous administration, including:
  —Minimizing inflammation and pain
  —Discussing important safety information
  —The progressive improvement of clinical signs2,3,4

Why dog owners purchase at their Veterinary Clinic:5

- Convenience
- I trust that I am getting genuine product
- Expert advice is available at this location
- Product is only available at this location
- Lower price

RIMADYL Chewable Tablets: A Compliance Solution

The palatability of RIMADYL® (carprofen) chewable tablets, combined with once or twice-daily dosing, makes these chewable tablets a great solution for overcoming many compliance issues.

- 3 out of 5 owners said they prefer a flavored chewable tablet for medicating their dog
- RIMADYL chewable tablets are designed to taste good, so dogs think of them as a treat. When dogs look forward to getting a chew, administration becomes part of the owner’s daily routine, making dosing manageable and compliance convenient.*

With more than 10 years on the market, RIMADYL has the longest track record of any canine NSAID and has safely treated more than 16 million dogs. Veterinarians prescribe RIMADYL more than all other NSAIDs combined—making it the #1 NSAID.9

*Remember, RIMADYL chewable tablets are designed to taste good to dogs, so remind owners to keep the medication in a secured storage area out of the reach of their dogs and other pets to prevent possible overdose.

Important Safety Information:
As with other NSAIDs, rare but serious side effects involving the digestive system, kidneys, or liver may occur. Regular monitoring is required for pets on medication. Pet owners should be advised to discontinue RIMADYL therapy if side effects occur and to contact their veterinarian. Refer to the full prescribing information for complete details.

## The Importance of Compliance for Dogs with Osteoarthritis

Studies show that continuous, long-term use of NSAIDs provides clinical benefits, without an increase in the incidence of side effects.²,³,⁴

Specifically, using RIMADYL® (carprofen) over the long term has been found to be safe and improve clinical signs.²,⁴

### Some ways to increase compliance:

- Easy to administer formulations such as chewable tablets
- Simple, less frequent dosing schedules
- Greater communication between pet owners and veterinarians

### Chewable tablets are preferred by both veterinarians and dog owners⁵,⁷ and are a solution to overcoming compliance issues.

---

7. 2009 AAHA Compliance Follow-up Study.
Sterile Injectable Solution 50 mg/mL

There were no serious adverse events reported during clinical field studies for the injectable formulation. The following categories of abnormal health observations were reported:

- Dermatitis/Skin lesion
- Diarrhea/Soft stool
- SAP increase
- Behavior change
- Vomiting

Most frequent abnormal health observations were vomiting and were observed at approximately the same frequency in Rimadyl- and placebo-treated groups. Changes in clinical chemistry indices of hematopoetic, renal, hepatic, and clotting function were not clinically significant. The mean post-treatment serum ALT values were 4.5 IU greater and 0.9 IU less than pre-treatment values for dogs receiving Rimadyl and placebo, respectively. Differences were not statistically significant.

INFORMATION FOR DOG OWNERS:

Rimadyl should not be used in dogs exhibiting previous hypersensitivity to carprofen. Rimadyl should not be given to dogs exhibiting previous hypersensitivity to any of the components of the capsule or to any other member of the sulfonamide or sulfa class of drugs.

Rimadyl should be given with caution to geriatric dogs because they are more susceptible to the potential adverse effects of Rimadyl. Rimadyl may also be more effective in geriatric dogs because these animals often have some degree of renal dysfunction.

Rimadyl should not be used in dogs with a history of renal disease, in dogs with a history of renal disease and with pruritus, in dogs with a history of renal disease and with a history of pancreatitis, or in dogs with a history of renal disease and with a history of chronic kidney disease.

A single dog may have experienced more than one occurrence of an event. A single dog may have experienced more than one occurrence of an event.
